

## Rationalizing EV Charging Infrastructure Availability for Urban/Rural India

### Overview:

As a person (or a good) travels from different modes of transport, they face differing levels of service in each leg. One bad experience (or leg) can ruin the entire journey process (for all stakeholders involved). How do ensure a uniform quality of service across multi-modal transportation (which witnesses multiple handshakes within one logistical/ transportation leg)

### Current challenges:

1. People refrain from adopting public transportation mediums due to varying levels of experience within the (end to end) journey.
2. One terrible experience (causer) gets away with it, and entire SC has to suffer for one causation. Can we effectively devise a plan to ensure uniformity in the experience levels across different modes?
